INTRODUCTION

Teflon is considered to be a high performance engineering plastic because of its service temperature up to about 300°C and high impact strength. Its tensile strength, fatigue strength and creep resistance are moderate. The electrical insulation properties are outstanding and are nearly as good as those of polyethylene. Teflon has excellent self-lubricating property and chemical resistance. Because of the above mentioned properties, Teflon products such as : rings, oil seals, gaskets, rods, bushes bearings etc. have got wide applications in automobile, electrical and chemical industries.

MARKET POTENTIAL

The automobile, electrical and chemical industries are growing at a faster rate in our country, therefore, there is a good demand for the Teflon products to be used by these industries.

BASIS AND PRESUMPTIONS

1. The scheme is based on single shift basis (8 hours per shift) and 300 working days per annum.
2. The estimated costs are drawn for the production capacity generally indicated techno-economically viable for a model type of activity.
3. Costs in respect of land and building, machinery and equipments, raw materials and the selling prices of the finished products etc. are those generally obtained at the time of preparation of the project profile and may vary depending on various factors.
4. The time period for achieving full/ envisaged capacity utilization is three years.
5. State Financial Corporation presently charges the interest rates @ 14% per annum.

6. The labour wages are considered as per the prevailing rates which may vary from place to place.
7. The margin money is 25% for fix capital and working capital.
8. The pay back period for the project is 4 years.

IMPLEMENTATION SCHEDULE

1. Time required for preparation of project report, Selection of site and SISI Registration etc. is Six months.
2. Time required for availability of finance/loan, construction of factory shed, Machinery procurement, erection and commissioning, trial runs and recruitment of staff and labour, permanent registration etc.

TECHNICAL ASPECTS

Process of Manufacture

Teflon moulding powder is filled in the mould and pressed in the hydraulic press to get the intermediate product. It is then sintered in the oven at 600°C where the Teflon particles are fused with each other to the strength. The product is then cooled and machined on high speed lathe, if required according the need of the end-product.
